Invention Disclosure

Inventor: Charles Andrew Lowry

Address: 770 East Vine Street #B, Salt Lake City UT. 84107

Title of Invention: Liquid Refining Device

To record Conception, describe: 1. Circumstances of conception, 2. Purposes and advantages of invention, 3. Description, 4. Sketch, 5. Ramifications, 6. Possible novel features, 7. Closest known prior art, and 8. Any previous disclosure of conception.

1. The invention is the result of a reevaluation of my patent, number 5,776,315, which reevaluation arose from the requirement to produce a Liquid Refining Unit with less cost and better serviceability.
2. This invention allows the oil refining mechanism to be mounted directly onto any internal combustion engine which uses a conventional type oil filter. As an additional consequence of this design, the need for mounting brackets, oil supply hoses, and the like has been eliminated.
3. This Liquid Refining Device refines liquid by metering the liquid flow to a slow rate thus creating a thin film within the evaporation chamber of the oil refining unit. With the proper environmental conditions imposed upon the liquid, this thin film of liquid allows other different liquids and gases which are desired to be separated from the liquid to evaporate and vent out the Vent Hole. The refined liquid exits the Liquid Refining Device by way of the Liquid Outlet.

Inventor and possessor of all rights hereto:

Charles Andrew Lowry
